*Owner's Manual*

**INPUT** - connect to guitar or effect before Loop or Loop before Loop

**OUTPUT** - connect to amp or another Loop

**L SEND** - connect to first pedal (in Loop) input

**L RETURN** - connect to last pedal (in Loop) output

\* Use the SmolскиTech Loop anywhere to eliminate loading down of signal. For use where you experience loss of tone and/or volume while pedal/s are bypassed (or off). Choose where your loops occur carefully. I like to have my tube screamer before the first loop as it doesn't load down much and I'm never caught off guard. If the tube screamer were in the loop, there would be a chance of being in bypass upon the start of a solo (we all get caught off guard from time to time).
